# **DETERMINANTS OF URBAN HOUSEHOLD DEMAND FOR CASSAVA AND CASSAVA PRODUCTS IN KADUNA, NORTHERN NIGERIA**

# Outline

---

- Significance of the study
- Research Methodology
- Explanation of Results
- Conclusion and Recommendation
- Display some Cassava Photos

# Significance of the study

---

- Consumption parameters are needed at the macro level to link aggregate food consumption to production levels, food imports and exports.
- At the micro level, consumption parameters are used to determine the implications of price and income changes on nutritional status, especially among the poor.
- To identify commodities which are important to poor and to rich.
- It enables us to identify the market potentials of commodities.

# Sampling Procedure

---

**Income status-purposively selected**

**Enumeration Areas**

**360 houses-randomly selected**

**360 households-randomly selected**

# Hypotheses

---

- Food budget share of cassava and cassava products across different income groups is the same (**Chi-square Test**)
- The determinants of household demand for cassava and cassava products are
  - Income
  - Price
  - Household characteristics (**AIDS Model**)

# AIDS Model

---

- Developed by Deaton and Muellbauer (1980).

Specified as :

- $$W_i = \alpha_i + \rho_{ih}h + \rho_{id}d + \rho_{ie}e + \rho_{ig}g + \sum_j \gamma_{ij} \log P_j + \beta_i \log(x/p^*)$$

# Dependent and Independent variables

<b><i>Dependent variable (<math>W_i</math>)</i></b>	<b><i>Budget share of the <math>i^{\text{th}}</math> commodity</i></b>
<b><i>Independent variables:</i></b>	
<b><i>Household size (<math>h</math>)</i></b>	<b><i>Number of persons in the household</i></b>
<b><i>Education level of household head (<math>e</math>)</i></b>	<b><i>In Years</i></b>
<b><i>Gender of household head (<math>g</math>)</i></b>	<b><i>A dummy variable (1 if Male, 0 if Female)</i></b>
<b><i>Dependency Ratio (<math>d</math>)</i></b>	<b><i>Dependents (<math>&lt; 15</math> or <math>&gt; 65</math>) over independents (<math>15 \leq x \leq 65</math>)</i></b>
<b><i>Price of commodities (<math>P_j</math>)</i></b>	<b><i>Price in Naira per unit</i></b>
<b><i>Total expenditure on the commodities (<math>X</math>)</i></b>	<b><i>Designated as <math>\text{Log}(X/P^*)</math> in the model</i></b>
<b><i>Price Index (<math>P^*</math>)</i></b>	<b><i>Defined as <math>\text{Log } P^* = \sum_j w_j \log P_j</math></i></b>

# Household characteristics by per capita expenditure quartile

CHARACTERISTICS	QUARTILE			
	1 N=90	2 N=90	3 N=90	4 N=90
Household size	8.1	7.4	6.7	4.1
Dependency ratio	0.87	0.82	0.79	0.67
% of male headed households	90.0	94.4	94.4	93.3
% of food expenditures in total expenditure	46.4	47.6	43.9	27.0
% of cassava expenditures in total food expenditure	6.48	6.19	3.61	3.54

# Share of cassava products in total food expenditure

---

<b>cassava Products</b>	<b>Percentage share</b>	<b>Number of consumers</b>
Cassava tubers	1.28	81
<b><i>Gari</i></b>	<b><i>3.08</i></b>	<b><i>252</i></b>
Cassava flour	0.46	37
Cassava chips	0.11	7
<b>Total</b>	<b>4.93</b>	<b>377</b>

# Comparison of cassava to other root crops

	QUARTILE				
	1	2	3	4	ALL
<u>Cassava</u> Yam	21.9	16.4	12.7	10.2	13.6
<u>Cassava</u> Potato	136.0	186.0	84.9	60.7	92.6
<u>Cassava</u> Cocoyam	72.3	96.4	55.5	36.5	54.9

# Expenditure and uncompensated (Marshallian) price elasticities

	Budget share	Expenditure elasticities	Cassava tuber	<i>Gari</i>	Yam	Potato	Cocoyam
Cassava tuber	0.028	0.321	-0.456	0.212	0.138	-0.211	-0.890
<i>Gari</i>	0.207	1.104	0.537	-0.407	0.329	-0.289	0.088
Yam	0.534	1.303	1.024	0.835	-0.718	0.107	0.451
Potato	0.165	0.452	-0.514	-0.568	0.951	-1.006	-1.187
Cocoyam	0.066	0.755	0.398	0.215	0.438	-0.330	-0.670

# Expenditure and own-price elasticities, by income group

	UNCOMPENSATED OWN-PRICE ELASTICITY			EXPENDITURE ELASTICITY		
	INCOME GROUP			INCOME GROUP		
	LOW N=90	HIGH N=90	ALL N=360	LOW N=90	HIGH N=90	ALL N=360
<b>Cassava</b>	<b>-0.96</b>	<b>-0.13</b>	<b>-0.46</b>	<b>0.73</b>	<b>0.26</b>	<b>0.32</b>
<b>Gari</b>	<b>-0.44</b>	<b>-0.35</b>	<b>-0.41</b>	<b>1.16</b>	<b>0.92</b>	<b>1.10</b>
<b>Yam</b>	<b>-0.21</b>	<b>-0.78</b>	<b>-0.72</b>	<b>1.21</b>	<b>1.56</b>	<b>1.30</b>
<b>Potato</b>	<b>-1.18</b>	<b>-0.46</b>	<b>-1.01</b>	<b>0.66</b>	<b>0.14</b>	<b>0.45</b>
<b>Cocoyam</b>	<b>-0.72</b>	<b>-0.24</b>	<b>-0.67</b>	<b>1.05</b>	<b>0.60</b>	<b>0.76</b>

# Compensated (Hicksian) price elasticities

	Cassava tuber	<i>Gari</i>	Yam	Potato	Cocoyam
Cassava tuber	<b>-0.447</b>	<b>0.278</b>	<b>0.309</b>	-0.136	-0.869
<i>Gari</i>	0.568	<b>-0.178</b>	0.919	-0.107	0.161
Yam	1.295	1.105	<b>-0.022</b>	0.322	0.536
Potato	-0.501	<b>0.662</b>	1.192	<b>-0.931</b>	-1.157
Cocoyam	0.419	0.371	0.841	-0.205	<b>-0.531</b>

# Conclusion

---

- Cassava is more important for the poor and it is fast changing from inferior food to a necessity.
- Gari is highly preferred to any other cassava products even among the rich households.
- Cassava tuber, gari and yam are strong substitutes.

# Recommendation

---

- Expansion of the production of *gari* and yam is necessary as these crops have expenditure elasticity greater than one.
- Government price interventions is not necessary.
- The development of appropriate and cost effective farm-level cassava processing technologies is required.
