

Growth and resource use of young rubber (*Hevea brasiliensis*) on hillsides in northern Thailand

Nuttapon Khongdee¹, Wanwisa Pansak¹ and Thomas Hilger²

¹Department of agricultural science, Faculty of agriculture, natural resources and environment, Naresuan University, Thailand ²Institute of Agricultural Sciences in the Tropics (Hans-Ruthenberg-Institute), Section Agronomy in the Tropics and Subtropics (490e), University of Hohenheim, 70599 Stuttgart, Germany

Objectives

- Evaluate rubber growth and nutrient uptake under soil conservation practices
- Identify cropping options for non-traditional extension areas

Materials and Methods

Site description

- Wang Thong district (16°55' N, 100°32' E), Phitsanulok province, Thailand.
 - Slope gradients:18 20%

Soil and rubber leaf nutrient concentrations. Data are averages of 2014

	Soil nutrients										
Treatments	С	Ν	C/N	P _{av}		K _{ex} Ca _{ex}		Mg_{ex}	K/Mg	g K/Ca	Mg/Ca

ns = Non-significant at p > 0.05; * = Significant difference of average value among treatments (p < 0.05); Different letters

- Elevation is 209 m a.s.l.
- Tropical savannah (AW) climate
 Annual rainfall: ~1200 mm
 - Temperature range 23-33°C

- Fine-loamy, mixed, semiactive, isohyperthermic Typic Haplustults
- Parent material: residuum from sandstone
- Texture: clay loam
- Soil depth: 70 cm

within the column showed the significant difference of average values among the treatments by DMRT (p < 0.05).

Comparison of soil and leaf values with the standard recommendations of the Rubber Research Institute (Suchartgul et al., 2012)

	Soil properties		Optimum range		Observed values in the rubber plantation							
						Sole rubb	er	Rubber intercropping				
				Low	Optimu	m Hig	gh	Low	Optimum	High		
	Carbon (%)		0.05-0.15)			\bigcirc	
	Nitrogen (%)		0.11-0.25

Strongly acid (pH 5.5)

Experimental design & treatments

- Plot size: 9 x 10 m
- Trial established in 2013 when rubber (RRIM 600) was 3 years old
- > Tree spacing: $3 \times 7 \text{ m}$.
- Trial layout: randomized complete block design; 3 treatments, 3 reps.
- Soil and leaf sampling for nutrients analysis.
- Crop growth measurements.

(i) Sole rubber

(ii) Rubber+Maize

(iii) Rubber+Maize+Legumes

Conclusion

The soil and water conservation systems tested provide a fair resource use and improve economic output, avoiding negative environmental impacts. Rubber intercropping with annual crops is, hence, a viable alternative for farmers in non-tradional cropping areas.
