#### Introduction

- Maintaining high shoot potassium concentration is beneficial for salinity tolerance.
- Adding potassium (K) in different chemical forms (sources) might mitigate salt stress.
- Effects of potassium sources on sweetpotato grown under salinity not yet described.

### Conclusions

- Potassium sources had different effects on the two sweetpotato varieties grown under salinity.
- K<sub>2</sub>SO<sub>4</sub> and KH<sub>2</sub>PO<sub>4</sub> were most beneficial for CIP1.8 and CIP2.1 respectively in terms of biomass and root-shoot ratio increase.
- All K sources increased K concentrations in middle section\* leaves and leaf petioles of both varieties, suggesting enhanced phloem loading and sugar translocation.
- Choosing the matching K source per genotype can enhance biomass and its distribution.

#### Results and Discussion KH2PO4 K2S04 no K 20 20 -24 -12 24 50 30 10 30 70 Total shoot dry weight (DW) g Shoot potassium concentration mg/g DW Petioles middle section K conc. mg/g DW\* KH2PO4 CIP18915**1.8** K2S04 CIP18800**2.1 KCI** no K 1.4 0.7 1.4 **Shoot K/Na ratio Root-shoot ratio** Leaves middle section K conc. mg/g DW\*

- → DW increase with all three potassium sources in CIP1.8, increase only with K<sub>2</sub>SO<sub>4</sub> in CIP2.1.
- → Increase in root-shoot ratio with K<sub>2</sub>SO<sub>4</sub> and KH<sub>2</sub>PO<sub>4</sub> in CIP1.8 and in CIP2.1, respectively.
- → Decrease of K concentration with all K sources in CIP1.8, increase under all in CIP2.1.
- → Increase of K/Na ratio with KCl in CIP 1.8, with KCl and KH<sub>2</sub>PO<sub>4</sub> in CIP 2.1.
- → Strongest increase with KCl in CIP1.8.
- → Increase in petiole K concentration under all sources in both varieties, except with KH<sub>2</sub>PO<sub>4</sub> in CIP2.1.
- → Increase in leaf K concentration with all three sources in both varieties.
- → Strongest increase with K<sub>2</sub>SO<sub>4</sub> in CIP2.1.

## **Materials and Methods**

**Experimental set-up**: Split-Plot designed greenhouse pot trial run in 2025 at the University of Hohenheim. **Treatments**: Irrigation (Freshwater, Saltwater - 150 mM), Variety (CIP189151.8, CIP188002.1), Potassium (no K, KCl, K<sub>2</sub>SO<sub>4</sub>, KH<sub>2</sub>PO<sub>4</sub> - 60kg/ha K); Salinity and potassium treatment onset 31 days after planting; n=4. **Sampling**: Shoot, fibrous and storage roots harvested destructively at 58 days after transplanting; \*middle section is the part of the vine that was established between 28 and 44 days after transplanting. **Laboratory analyses**: Dry weight after 48 hours at 70°C; Shoot biomass: concentration of sodium and potassium by hot water pressure extraction via autoclave and flame photometer measurement according to *Asch et al. 2022*.
